RATIONALE

Childhood myelodysplastic syndromes (MDS) represent a heterogeneous group of rare hematologic disorders (5% of all hematopoietic neoplasms of pediatric age), with distinct subtypes defined by cytogenetics, number of affected lineages, severity of cytopenia, cellular dysplastic morphology, and blast counts.

Underlying genetic predisposition is recognized with increasing frequency in these patients. Extensive next-generation genetic characterization has been recently investigated in childhood MDS, allowing a new diagnostic approach and genetic risk factor stratification. Allogeneic hematopoietic stem cell transplantation (HSCT) offers the potential to cure many patients with MDS. Nowadays, new therapeutic options, including demethylating agents and immunotherapy, are under investigation. In the future, treatment strategy will be tailored based on more refined prognostic factors and molecular findings may help in this setting.

Severe Aplastic Anemia (SAA), the paradigm of bone marrow failure syndrome, is a rare disorder, in which major advancements in therapy have been obtained through the application of immunosuppressive therapy and allogeneic HSCT.

The meeting will address all the relevant biological clinical aspects of childhood MDS and SAA, focusing on new insights on diagnosis, prognosis, and management of these diseases, as well as on the newest results in basic and translational research. Recognized, outstanding international leaders will deliver the main lectures, but also high-level research talks selected from the best abstracts submitted by attendees will be presented.
